pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

CHOSRBL 1989 bp DNA linear PLN 29-MAR-2001

LOCUS Rice chloroplast DNA for ribulose-1,5-bisphosphate carboxylase

(clone PCR-1).

ACCESSION X04789

VERSION X04789.1 GI:11954

KEYWORDS

ribulose biphosphate carboxylase.

SOURCE

Oryza sativa.

ORGANISM

Oryza sativa. Viridiplantae; Streptophyta; Embryophyta; Tracheophyta; Eukaryota; Magnoliophyta; Liliopsida; Poales; Poaceae; Ehrhartoideae; Oryzaceae; Oryza.

REFERENCE

1 (bases 1 to 1989)

AUTHORS

Moon, E., Kao, T.H. and Wu, R.

TITLE

Rice chloroplast DNA molecules are heterogeneous as revealed by DNA sequences of a cluster of genes

 COMMENT The following sequence is an artificial clone that will be used for
 gap filling in the rice genome. There is 60 kb of sequence from
 the overlapping north clone (OSJNAB0075K12) and 60 kb of sequence
 from the overlapping south clone (OSJNAB0022D10) and the gap
 filling sequence begins at 60,001 and ends at 65,936 for a total
 size of 125,936 bases. The gap filling sequence is 5936 bases. The
 name (OSJNAB0075K12) was derived from the location of the north
 clone and the 'A' stands for Artificial.

	CC	The methods comprise ligating an open reading frame containing a promoter and 2-100 genes of interest, to a vector and integrating the resulting recombinant vector into a plastid chromosome. The methods are useful for transforming a plant, belonging to any family such as Gramineae, Malvaceae, Brassicaceae, Compositae, Pedaliaceae, Oleaceae, Myrtaceae, Rosaceae, Thiocaneae, Leguminosae, Palmae, Sterculiaceae or Rubiaceae. In particular Nicotiana tabacum of Solanaceae family, for producing polyester, which is copolymer of lower alkyl 3-hydroxyalkanoic acid. In the present invention polymer synthase genes (see AAF84261-AAF84264) were used in the method to generate a plant which produces polyester. In order to ensure that homologous recombination is carried out in the plastid chromosome, the present sequence, the rbcL and ORF512 genes, which exist in the plastid were used.

 XX New recombinant DNA constructs, for expressing high levels of

PT heterologous protein in plastids of higher plants, includes promoter, a
 PS leader sequence and a downstream box element -
 XX Disclosure; Fig 29; 164pp; English.
 XX
 CC The present sequence represents a DNA construct of the invention.
 CC The specification describes recombinant DNA constructs for expressing
 CC heterologous proteins in the plastids of higher plants. The DNA
 CC constructs comprise a 5' regulatory region which includes a promoter
 CC element, a leader sequence and a downstream box element operably linked
 CC to a coding region of the heterologous protein. The chimeric regulatory
 CC region enhances translational efficiency of an mRNA molecule encoded by
 CC the DNA construct. The DNA constructs are used for producing transformed
 CC monocot and dicot plants having high levels of heterologous protein
 CC expression. They can be used to drive expression of proteins with
 CC agronomic, industrial or pharmaceutical importance, including production
 CC of vaccines, healthcare products like human haemoglobin, industrial or
 CC household enzymes. Plants which can be transformed with the constructs
 CC of the invention include maize, millet, sorghum, sugar cane, rice,
 CC wheat, barley, oat, rye or turf grass.

XX XX omega-type (Prm) promoter with rbcL translation control sequences,
XX XX without a downstream box. The chimeric promoter is used, as a 5'
XX XX regulatory sequence, to produce recombinant DNA constructs for expressing
XX XX heterologous proteins in the plastids of higher plants. The DNA
XX XX constructs comprise a 5' regulatory region which includes a promoter
XX XX element, a leader sequence and a downstream box element operably linked
XX XX to a coding region of the heterologous protein. The chimeric regulatory
XX XX region enhances translational efficiency of an mRNA molecule encoded by
XX XX the DNA construct. The DNA constructs are used for producing transformed
XX XX monocot and dicot plants having high levels of heterologous protein
XX XX expression. They can be used to drive expression of proteins with
XX XX agronomic, industrial or pharmaceutical importance, including production
XX XX of vaccines, healthcare products like human haemoglobin, industrial or
XX XX household enzymes. Plants which can be transformed with the constructs
XX XX of the invention include maize, millet, sorghum, sugar cane, rice,
XX XX wheat, barley, oat, rye or turf grass.

 XX
 DR Production of transplastomic plants - by transfection with plasmid
 XX targeted DNA, specifically for Cruciferous plants
 XX
 PS Disclosure: Fig 7: 45pp; English.
 XX
 CC This sequence comprises the plasmid targeting region of plasmid
 CC PG85A. This plasmid carries a neomycin phosphotransferase (neo)
 CC gene that confers kanamycin resistance gene, flanked on both sides
 CC by Arabidopsis plasmid targeting sequences. It was produced by
 CC ligating the neo gene into the unique HindIII site of plasmid pGS7
 CC (see AAT8194). A novel method of producing transplastomic plants
 CC involves delivering transforming DNA, preferably cloned in pGS31a,
 CC pGS85A or pGS7, to a plasmid genome of plant cells in culture,
 CC selecting cells with transformed plasmids and regenerating these to
 CC plants. Transforming DNA comprises (i) (1) several targeting
 CC sequences (i.e. plasmid DNA sequences from the genome to be
 CC transformed) to allow homologous recombination, (ii) 5' and 3'
 CC regulatory regions from plasmid DNA linked to a selectable marker
 CC gene, (iii) regulatory regions controlling a foreign gene of
 CC interest, and (iv) at a cloning site for insertion of the foreign
 CC gene adjacent to the marker gene. The method is used to transform
 CC cruciferous plants, e.g. Brassica species. The combination of
 CC homologous recombination, selectable marker and use of plasmid
 CC regulatory sequences improves generation of stably transformed
 CC plants. Expression of foreign genes in plasmids, rather than in
 CC the nucleus, avoids risk of transmitting the foreign gene in the
 CC pollen, provides high levels of protein expression, permits
 CC simultaneous incorporation of several genes and avoids the
 CC positional effects and gene silencing associated with nuclear
 CC transformation.

 XX
 CC A computer readable medium has been developed which has recorded on it

982 nucleotide sequences isolated from the *Enterococcus faecalis* genome. AAH12398 to AAH13919 represent these nucleotide sequences which are primary nucleotide sequences, also known as contigs. The computer-based system can identify fragments of the *Enterococcus faecalis* genome with commercial importance. The products can be used to detect the presence of *Enterococcus faecalis* in samples. They can also be used for diagnosing *Enterococcal* infection in an animal and monitoring progression of disease, and for identifying agents which can be used to modulate the growth or pathogenicity of *Enterococcus faecalis*, or another related organism, in vivo or in vitro. In particular the polypeptides encoded by the *Enterococcus faecalis* nucleotide sequences can be used in vaccines to prevent or attenuate an *Enterococcal* infection.

XX New nucleotide sequences isolated from *Pyrococcus abyssi* encode

XX proteins useful in industry -

XX Claim 1; Page 429-524; 1657pp; French.

XX The present invention relates to the genomic sequence of *Pyrococcus*

XX *abyssi* and *P. abyssi* proteins (see AAB96053-AAB96842). *P. abyssi* is a

XX hyperthermophilic archaeon, which is isolated from deep-sea hydrothermal

XX vents. The present sequence is a fragment of the genomic sequence of *P.*

XX *abyssi*. The 5' end of this sequence overlaps with the 3' end of AAH1224

XX and the 3' end of this sequence overlaps with the 5' end of AAH1226. The

XX proteins of the present invention have various potential industrial uses,

XX since the proteins are stable at very high temperatures, some up to 110

XX degrees centigrade.

XX Note: This patent is in the same patent family as WO200065062, which

XX contains additional sequences as shown in AAB99132-AAB99143,

XX AAH15903-AAH15920 and AAG66436.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequences have been trimmed to exclude PolyA, vector and regions
 below Phred quality 16. The threshold for highest quality sequence
 is 20.
 Seq primer: JEN REV
 High quality sequence stop: 495
 POLYA-NO.

FEATURES

location/Qualifiers
 1..551
 /organism="Sorghum bicolor"
 /db_xref="taxon:4558"
 /clone_lib="Pathogen induced 1 (P11)"
 /note="Organ: Anthracnose-infected leaves from
 two-week-old sorghum plants 48 hr after inoculation;
 Vector: pBluescript II from lambda zap II. Site 1: XhoI;
 Site 2: EcoRI. Two-week-old sorghum plants (BRX 623
 cultivar) were infected with pathogen (isolate PRM421 of
 Colletotrichum graminiicola, which is a sorghum isolate)."

RNA was prepared from infected leaves harvested from 45
 seedlings (2 weeks old) exhibit juvenile resistant
 reaction, which is an incompatible interaction. As they
 grow older (4 weeks or older), plants resume susceptibility
 to anthracnose disease. The library was made from poly-A
 RNA in the cloning vector lambda zap II. Clones to be
 sequenced were prepared by mass excision. WARNING: While
 most or all ESTs are expected to derive from the host
 plant, no effort was made to eliminate ESTs deriving from
 the pathogen."
